

Radiation Monitoring systems and Measurement Instruments Produced in Turkey

Early Warning Environmental Radiation Monitoring System / On-Line Network (RESA) includes smart probes for radiation detection and server software running on a personal computer that accumulates, processes and monitors data generated by the probes. The communication that exchanges data between the probes and the server software occurs over the public telephone lines. Thus the system enables the authorities to monitor the radiation levels all over the country, virtually, in real time and stores data for evaluation and retrieval any time it is required.
